* NEW USE CASES
IoF 2020 IN A NUTSHELL

The Internet of Food and Farm 2020 (IoF2020) project aims to consolidate Europe’s leading position in the Internet of Things (IoT) technology applied to the agri-food sector. We develop an ecosystem consisting of farmers, food companies, policy-makers, technology providers, research institutes and end-users. The project aims to solve the European food and farming sectors’ social challenges, maintain their competitiveness and increase their sustainability.

FOR MORE INFO: IOF2020.EU
LEAN MULTI-ACTOR APPROACH
IoF2020 uses a lean multi-actor approach focusing on user acceptability, stakeholder engagement and the development of sustainable business models. IoF2020 aims to increase the economic viability and market share of developed technologies, while bringing end-users’ and farmers’ adoption of these technological solutions to the next stage.

THE STANDARDS
With an open ecosystem and collaboration space, the project relies on existing standards, as well as security and privacy platforms, applying these to the food production chains.

TOWARDS AN ECOSYSTEM
Led by the Wageningen University and Research (WUR), the 120+ members consortium includes partners from agriculture as well as ICT sectors and uses open source technology provided by other initiatives (e.g. FIWARE). Together we build an innovation ecosystem in which technology is validated, knowledge is shared and innovative solutions are brought to market.

GOVERNANCE & STRUCTURE
IoF2020 is structured in 6 Work Packages, developed to help IoF2020 deliver its results.
Our Work Package is in charge of the overall organisation of the project. We coordinate all activities and monitor their progress. We handle the finances and are the contact point for the European Commission. Furthermore, we ensure a smooth and well-organised project, so all Work Packages and use cases can perform optimally. Basically, we try to keep everybody happy: a challenging task!

We monitor and support use cases and trials (sectors). We connect the teams that work in the field with the large pool of experts within the IoF2020 ecosystem. By constantly observing all use cases from a birds-eye view, we identify common challenges, opportunities for collaboration and replicable best practices. These best practices will boost the IoF2020 impact for European farmers and consumers.

We aim at identifying IoT technologies that offer solutions for the agri-food domain. We support our teams to validate these promising technologies since components used throughout all IoF2020 use cases might be reusable in other situations. Hence, we are working on technological synergies that make the development of IoT-based solutions more efficient and effective.

It is our objective to support use cases in dealing with ethical questions. Moreover, we develop a perspective on responsible data sharing together with stakeholders (policy-makers, farmers, tech service providers, NGOs, researchers). The public goals of IoF2020 may not always coincide with the goals of businesses or other stakeholders. What 'success' means therefore depends on the perspective of the stakeholder that you speak to. Thus, we aim for a well-argued match.

KEY FACTS

• Funding Scheme: Horizon 2020, Industrial Leadership, IOT-01-2016
• Contribution of the European Union: €30 million
• Total costs: €35 million
• Duration: 4 years, 2017-2020
• Consortium: 120+ partners
• 5 trials: arable crops, dairy, fruits, vegetables and meat
• 33 use cases in 22 EU countries

FOR MORE INFO: IOF2020.EU
The IoF2020 project is organised around 5 agriculture sectors: arable crops, dairy, fruits, vegetables and meat. Within each trial several use cases demonstrate the value of IoT solutions for the European food and farming sectors.

FOR INTERACTIVE MAP:
IOF2020.EU/TRIALS
The arable trial focuses on wheat, soy bean and potato production and processing in Europe’s different climate zones. It includes activities across the cropping cycle: e.g. with the help of IoT technologies data relevant to growing crops is gathered (e.g. soil condition, humidity and weather conditions). This trial also includes machine-to-machine communication. Overall, the use of IoT in arable farming can help to reduce pesticide, fertilizer and energy use, while increasing transparency and food safety.

FOR MORE INFO: IOF2020.EU/TRIALS/ARABLE
Arable farming faces increasing requirements and challenges when it comes to resource efficiency, environmental protection, transparency and chain optimisation. To address this challenge, this use case seeks to:

- Develop specific IoT devices for acquisition of soil, crop and climate data in production and storage of key arable and vegetable crops;
- Showcase the benefits of the broad IoT implementation at the farm level.

The development of decision-making tools and services is a priority to help farmers adopt better practices and optimise input management for their fields. The elaboration of precise advice relies on accurate observations of crop status and the growing environment. Existing services use climatic data and satellite imagery that provide valuable information but have their limitations. The improvement of these services requires the highest spatial and temporal resolutions accessible, using ground-based sensors which measure nitrogen and water, the two main limiting factors impacting wheat production. In 2019, 35 systems are deployed in Ile de France and Provence regions to assess the technical and economic value of the IoT technology.

USE CASE TIME PLAN

1.1 WITHIN-FIELD MANAGEMENT ZONING

1.2 PRECISION CROP MANAGEMENT
SOYA PROTEIN MANAGEMENT

Soybeans are a major source of high-protein food and feed for livestock. Currently, the EU is highly dependent on imports from soya producing countries. Since an increasing number of farmers start to produce soybeans as protein crop in Europe, this use case addresses the lack of technological innovation in their cultivation and processing of protein plants in order to tap the huge potential in terms of improving the quantitative and qualitative outcome per hectare. IoT technology connects data and information on soil, weather, cultivation and harvest to support producers and to enable better traceability for certified value chains, thereby improving the transparency of plant and animal food products.

FARM MACHINE INTEROPERABILITY

Every farmer wants his equipment to work seamlessly together, designed as one integrated system that is interoperable regardless of vendor. Interoperability of IoT devices and machinery today is in its infancy. For the farmer it is a challenge to make all devices work together in the digital space, as there are different platforms using vendor specific communication.

1.5 POTATO DATA PROCESSING EXCHANGE

Being able to track produce back to the field regarding food security and quality, does not only support buyers and processors, it also helps farmers to identify problems and improve their yields in the following years.

As an important step towards smart digital farming, this use case:
- Collects information and opens data flows between stakeholders in the supply chain;
- Measures potato crop growth, yield prediction, caliber yield measurements on the harvester and traceability data from field location to location in the shed;
- Mounts IoT devices on the harvesting machines to gather precise location-based information;
- Facilitates data exchange with the processing industry according to the current state of the art in standardisation.

THE IMPACT

OUR OBJECTIVES
- Cover three test fields in three countries: Sweden, Poland and Belgium;
- Exchange the collected data with Farm Frites Poland, as processing industry partner in this use case;
- Focus on the standardisation of this data exchange.

ECONOMIC IMPACT
- Increase in yield (+10%);
- Reduction in fuel consumption (-10%);
- Gross margin (+5%);
- Reduce costs in processing industry;
- Give fast digital access to important information.

OTHER IMPACT
- Food waste through alignment of supply and demand (-10%);
- Improve harvested potato yield;
- Give farmers more insight in data elements for business optimisation.

HOW IT WORKS

Different data points will be collected in real-time on the different machines and will be analysed, stored and exchanged with other partners in this project. The IoT platforms of Aurea & AVR will be used as gateway.

In this use case farmers (Farm Frites Poland DWA) and the processing industry are present (Farm Frites Poland). AVR (potato machine manufacturer), Aurea Imaging (drone image analysis) and Octinion (caliber yield measurement) are developing the sensors and measurement principles supported by the IoT company Delaware.
1.6 DATA-DRIVEN POTATO PRODUCTION

European potato producers are facing a series of challenges such as crop pests, diseases and climate change. Hence, this use case adopts a holistic approach based on research and a unique blend of cutting-edge technologies while offering inexpensive yet valuable advice to farmers. An innovative, market-ready smart farming solution supports irrigation, pest management and fertilisation. Leveraging a network of telemetric IoT stations combined with satellite data and scientific models tailored to the specificities of the geographic areas, helps small-scale farmers to tackle those challenges.

HOW IT WORKS

Data-driven potato prediction utilises the GAIA sense smart farming solution which provides innovative services, building on state-of-the-art technologies like IoT, Big Data, Earth Observation, Context-based decision support and machine learning.

The GAIA sense solution is extended with FIWARE-powered, standards based, data exchange mechanisms in support of cross-system interoperability and openness.

THE IMPACT

OUR OBJECTIVES

• Demonstrate how the use of IoT-driven smart farming solutions can help reduce the environmental footprint of agriculture;
• Facilitating farmers’ compliance with a wide range of European environmental legislation, including water and soil protection;
• Improvement of nitrogen use efficiency (+15%);
• Reduction of pesticides use (-15%);
• Reduction of water consumption (-25%).

OTHER IMPACT

• Demonstrating the potential benefits derived from the use of IoT-driven solutions;
• Achieve sustainable economic growth and foster innovation;
• Reduction of inputs costs (-18,6%);
• Farmers benefited from the provided advice >500;
• Smart farming advice available up to 1500ha;
• Building on extensive business network in >50 countries.
1.7 TRACEABILITY FOR FOOD AND FEED LOGISTICS

This use case deploys an innovative approach that secures and authenticates the transport of bulk-goods in the agri-food chain, both for feed and food with zero risk of contamination. There is a need to guarantee the traceability of bulk food and feed delivered from the moment it leaves the loading station right up to when it is delivered to a farm's silo. A fully automated silo detection system, using IoT solutions, guarantees that the right bulk contents are correctly delivered, and that the specifics of that delivery are registered. This solution thus helps to prevent feed and food wastage caused by wrong deliveries.

HOW IT WORKS

The detection system requires the establishment of communication between the loading station and the trailer, using Wi-Fi routers. The transferred data lists which kinds of animal feed are loaded in the different compartments of the trailer.

A base station device, controller and TAG wireless reader are all installed on the bulk trailer. The moment this reader confirms the connection with the right silo, the matching compartment of the trailer can be released and unloaded. A unique TAG identification is installed on each silo for all delivery addresses.

THE IMPACT

OUR OBJECTIVES
• Real time data delivery and localisation of all trailers;
• Secured delivery procedures;
• Establish complete traceability from factory to client;
• Detailed monitoring of the discharging procedure;
• Direct alarm in case of deviations during the deliveries;
• Data concerning preventive maintenance of the end-user's transport fleet.

ON ECONOMY
• Reduce the recovery cost due to wrong deliveries of feed or food (-90%);
• Compatibility due to system interoperability (99%);
• Increase transport efficiency through data analysis;
• Reduce the destruction cost of contaminated silo content (-90%).

OTHER IMPACT
• Reduce the waste of contaminated silo contents (-90%);
• Lower the need for additional transport (less CO2 emissions), for silo cleaning and re-delivery of new feed by (-90%);
• Provide guidance and support for truck drivers during the delivery process;
• Increase farmers' trust in the delivery and quality of their feed;
• Improve food safety by securing the supply chain both for animal feed and human food.
1.8 SOLAR-POWERED FIELD SENSORS

The lack of access to affordable and scalable on-field diagnostics for small farmers is addressed through:

- Reduced design complexity to facilitate ease of use without the need for additional training;
- Integration of all farm information and devices in one farm manager;
- Development of sustainable marketing strategies to incentivise farmers to implement modern technology;
- Demonstration of sensor-based predictive analytics for diseases;
- Application of the solution on different crops.

THE IMPACT

ECONOMIC IMPACT
- Decreased farm operation and inputs costs (-30%);
- Cost saving on energy and water consumption (-35%);
- Crop productivity increase for potato, wheat, maize (+15-30%).

OTHER IMPACT
- CO2 Emissions reduction (-20%);
- Water conservation (-35% vs previous year);
- Cut down on fertilisers Ammonium Nitrate, Superphosphate, Potassium sulphate, Dolomite, and Magnesium sulphate;
- Soil health restoration;
- Reduction of pesticides usage.

OUR OBJECTIVES
- Calibrate and certify the devices to demonstrate the product among farmer networks of 4 institutions across 3 countries;
- Conduct micro-level market research;
- Develop a smart network of 2000 sensors to help farmers adopt sustainable farm practices;
- Demonstrate of sensor-based predictive analytics for diseases;
- Build self-sustainable communities.

HOW IT WORKS

Solar-powered field sensors offers plug and play IoT devices and AI-based precision farming solutions. The software analyses the soil-crop compatibility, crop requirements and nutrient deficiencies. The solution brings a soil laboratory to the fields and allows end-users to monitor and treat their crops in real time. This directly benefits farmers as it allows them to save water, minimise operating costs and reduce the risk of crop failures.

PARTNERS

2000 SMART SENSORS
- 30% ENERGY USE
- 35% FERTILISER INPUT
Within-Field Management Zoning Baltics

Spending on fertilisers and agrochemicals represents a considerable part of farmers’ overall expenditure. By developing a remote sensing solution to determine which nutritional elements and how much of them a plant is lacking at different stages of its growth, such costs can be reduced. This use case demonstrates the added value of spectral data analysis and IoT technology for precise decision-making and optimised crop management in potato and winter wheat.

How It Works

Integration of advanced hyperspectral imaging and data analysis technologies to deliver a truly innovative solution to some of the most pressing issues for farmers. It uses Artificial Intelligence technologies (Machine Learning/Neural Networks) to perform complex analyses of crop field hyperspectral images. By analysing big amounts of spectral data the system learns to recognise various indicators or patterns, and identifies the composition of nutrients in crops. The solution integrates with FMIS for mapping of micro- and macronutrients in potato and winter wheat plants.

The Impact

Economic Impact
- Yield increase (+5%);
- Field analysis time and cost (-70%);
- Soil fertility increase (+20%);
- Fertiliser cost reduction (40€ / ha).

Other Impact
- Fertiliser use reduction (-30%);
- Classified data increase (x8);
- Stress reduction (+20%);
- User satisfaction (+33%).

Our Objectives
- Fast and cost-efficient way to detect the amounts of micro- and macro-nutritional elements needed in plants;
- Automatic recommendations for agrochemical application through non-invasive, remote sensing technology;
- Display the benefits of soil, crop and yield sensors for yield prediction, arable field management and chain optimisation;
- Demonstrate the added value of hyperspectral imaging and spectral data analysis at the farm level.
The dairy trial explores the usefulness of collecting real-time sensor and GPS location data throughout the whole dairy chain—‘from grass to glass’, using neck collars or movement sensors for livestock. Use cases range from monitoring the outdoor grazing of cows (from ‘grass’) to the application of machine learning technologies and cloud-based services (to ‘glass’), making it possible to ensure the quality of the dairy chain remotely.

FOR MORE INFO:
IOF2020.EU/TRIALS/DAIRY
2.1 GRAZING COW MONITOR

The Grazing cow monitor digitally monitors cows' grazing time and grazing location providing an easy way to generate digital reports for farmers, legal controllers and dairy processors. This is important to verify the state and location of cattle, pasturing for ammonia emission reduction and labels of 'milk from pasture'. The system uses the STICKNTRACK low-power indoor-outdoor tracking service that combines the LPWAN SIGFOX network with BLE technology to track individual cows and measure their pasturing time. The system can also track extensively grazed livestock such as dairy cows, beef cattle, horses, sheep, and reindeer, but can also track wildlife.

2.2 HAPPY COW

Farmers do not need more data, in fact, farmers require deeper insight into their farm activity. Hence, this use case bridges the existing technology gap for farmers who seek advice on how to increase productivity, improve efficiencies, reduce health incidents and how to better care for a more fertile and happier herd. Through a combination of advanced sensor hardware technology and state of the art deep-learning algorithms, this use case takes the next step in the advancement of farming for the future.

2.3 HERDSMAN

This use case implements, validates and showcases the use of real time data primarily derived from a neck mounted collar together with other relevant data (milk constituent and feed sensors) to create information of value to the dairy supply chain from ‘grass to glass’. The impact is a more efficient use of resources and production of quality foods, combined with an enhanced animal health and environmental implementation. Through early intervention strategies stemming from warning systems and quality data that can be used for remote calibration and validation of sensors, this use case’s focus is on the welfare of cows. Ultimately, it also optimises the reproduction rate through increasing herd fertility.

2.4 REMOTE MILK QUALITY

This use case provides a quality assurance service of locally obtained milk and remote dairy composition analyses by using sensor appliances. Analytical instruments are monitored remotely and validated through the use of reference samples, calibration sets and software applications. This use case thus ensures:

• High safety, quality, sustainability and profitability in the dairy chain;
• Reliable results from instrumental analyses (IR) for dairy processors and local testing laboratories;
• Calibration and harmonisation expertise within an organization.

2.5 EARLY LAMENESS DETECTION THROUGH MACHINE LEARNING

Lameness is a substantial issue in the dairy industry – it entails pain and discomfort for the cow, and results in decreasing fertility and milk yield for the farmer. Current solutions are cost-intensive and involve complex equipment. Lameness can be addressed without having to spend a high amount of resources. By employing leg mounted sensors and machine learning algorithms lame cattle can be identified at an early stage, and the data acquired can be sent directly to the farmer so that treatment of lameness can start immediately.

HOW IT WORKS

The use case will build upon an existing trial for early lameness detection deployed on a farm in South East Ireland and extend as well as integrate this deployment into other IoF2020 use cases. The current deployment on a farm with 150 cattle utilises leg mounted sensors and uses Machine Learning for early lameness detection. The team will attach sensors from two separate vendors on cattle in dairy and beef herds in three further countries. The approach will thus be validated in different environments and scenarios.

THE IMPACT

OUR OBJECTIVES

- Integrate existing Lame Detection as a Service (LDaaS) into IoF2020 architecture;
- Extend the use case to integrate with existing third-party services;
- Expand the use case to new regions;
- Commercially validate the solution with multiple vendors.

ON ECONOMY

- Reduced animal mortality (-5%);
- Decreased milk yield loss due to lameness (-7%);
- Increased beef production (+10%);

OTHER IMPACT

- Lameness detection rate (+7%);
- Detection accuracy (87%);
- Improved reproduction efficiency index (+5%);
- Reduced usage of antibiotics (-5%).

NEW
2.6 PRECISION MINERAL SUPPLEMENTATION

Most economic losses in dairy cows happen during the critical transition period from 2-3 weeks before calving and 100 days after, due to health-related issues. To counter this, there is a need for correct and adequate mineral supplementation during the calving period. By deploying an advanced mineral feeder, cloud-based services, electronic ear tags and data-integration, this problem can be addressed through precision supplementation of dairy cows.

HOW IT WORKS

Precision Mineral Supplementation is a mineral feeder for dairy cows, to be mounted in the stable or in an outside motion area. The feeder is equipped with electronic components for the identification of the cows via their electronic ear tags which can be delivered with the feeders in case such ear tags are not already used in the herd. The herd manager decides via the user interface which cows shall have dosed mineral supplements in the feeders. Moreover, the user interface also allows for the monitoring of individual cow’s eating behaviour, making it easier to check on cows in the calving phase and respond appropriately. It is expected to prove a connection between those parameters and the cow’s performance as well as health.

THE IMPACT

OUR OBJECTIVES

The use case demonstrates precision mineral supplementation over twelve months in six dairy farms in Latvia, Germany and Lithuania, involving a total of 1.500 cows. Furthermore, it aims to showcase trial interoperability, replicability and the reusability of IoF2020 results or innovations, IoT layers and data flows via the cloud.

ON ECONOMY

Precision Mineral Supplementation is an easy, safe and efficient method:

• Costs for the feeder €4;
• Mineral costs per cow per year €27;
• Increase in milk per cow per day 1.2 kg;
• Reduction of health-related losses (-10%);
• Total savings per cow per year €146.

OTHER IMPACT

• Lameness detection rate (+7%);
• Detection accuracy (87%);
• Improved reproduction efficiency index (+5%);
• Reduced usage of antibiotics (-5%).

STARTED 2019 NEW
This use case aims to further develop and promote a precise and reliable cattle monitoring ecosystem utilising the needs of multi-country dairy and beef farmers, stemming from previous user feedback analysis. By harmonising their different breeding methods and setting novel as well as customised software features accordingly, a mobile device solution for daily operations on all farm levels is developed. The system is made up of a small rumen bolus and collar, monitoring various physiological data, and a cloud-based server application to provide accurate information for daily operations. It helps farmers to guard, track and monitor all assets with the help of reliable, affordable, low-power, wide-range network technologies and smart sensors.
The fruit trial aims to improve the use of IoT-technologies in the fruit supply chain, from growing to harvesting and processing. This trial will gather data on pre- and post-harvest losses to increase the yield and quality of fruits. In addition, IoT-technologies is used to ensure better traceability of fruit products in relation to the protected designation of origin. The use cases include, among others, fresh table grapes, wine and olives, while addressing the challenges of automation in the fresh logistics.

FOR MORE INFO: IOF2020.EU/TRIALS/FRUITS
3.1 FRESH TABLE GRAPES CHAIN

This use case integrates IoT technologies into the – conventional as well as organic - table grapes value chain and deploys them on farms of all scales. The farmers can therefore monitor their crop growth easily, allowing them to take better field operation decisions (e.g. spraying, irrigation, harvest). At field level, the implementation of IoT sensors produces not only economic benefits, it also yields positive environmental impacts due to improved resource management in terms of water, fuel and pesticide inputs. In the transportation process, technology helps to prolong shelf life, thus reducing spoilage.

3.2 BIG WINE OPTIMIZATION

Precision viticulture and remote vineyard monitoring are two promising new cultivation methods, allowing to monitor accurate weather data in real time, vine conditions (grape detection, phenological stage determination, and disease status characterisation) and key winery conditions with IoT technology. This use case therefore optimises the application of plant protection products through precise treatment identification and positioning, reducing the environmental impact and resource consumption while efficiently protecting grapes. Furthermore, selective harvesting and data analysis help facilitate decision-making to improve production, accelerate and automate the inspection time while delivering accurate results. In addition, winery monitoring avoids temperature and humidity issues causing wine evaporation especially during summer time.
The EU is the largest producer and consumer of olive oil in the world. However, increasing competition from other countries and the rapid decline in olive plantations caused by plant pathogens puts the olive sector under pressure. This use case thus overhauls the olive chain by realising automated field control, product segmentation, processing and commercialisation of olives and olive oil. IoT technologies allow to:

- Automatically take data from crops and postharvest machines, in order to provide inputs for DSS (Decision Support Systems) models;
- Optimise efficiency of resource consumption through monitoring and controlling of agricultural machinery as well as irrigation systems based on agronomic models;
- Measure the fat content and monitor quality during milling process to improve food safety.

Food companies are challenged by public and private demands from different points of the supply network. However, a lot of data is collected at different stages and not well-communicated along the chain. A basic traceability is implemented, to ensure better communication. New mechanisms are required for production and transport of information to improve efficiency of the supply network.
3.5 SMART ORCHARD SPRAY APPLICATION

Agriculture focused on speciality crops faces the challenge of improving the profitability whilst also reducing negative environmental impacts. This use case demonstrates that plant protection products can be significantly reduced through IoT enabled airblast atomising sprayers, adapting automatically to specific field zones as well as individual plant conditions. The integration of the Smart Orchard Spray Application cloud into farmers’ existing processes and software solutions further increases operating efficiency.

HOW IT WORKS

The Smart Orchard Spray Application enables the development of a new integrated market of speciality crops management systems:

- Connection of physical IoT devices to the SCP;
- Configuration of work orders from the SCP;
- Farmer’s work based on the use of IoT enabled devices to carry out precise actions;
- Wireless connection of the tractor and the sprayer to the SCP;
- Tracking of all data gathered by the IoT devices;
- Total control of costs and work issues registered from the IoT devices connected to the SCP.

THE IMPACT

OUR OBJECTIVES

- Perform highly efficient, effective and environmentally friendly specialty crops protection in cherry, apple and almond production;
- Increase sustainability and profitability of food production;
- Monitor operations and get instant information on treatment quality;
- Provide traceability to improve the food security standards;
- Monitor costs and bridge the gap between agronomics and company accounting to increase business revenue;
- Assist in documentation tasks related to adherence to farm certification schemes like GLOBALG.A.P.

ON ECONOMY

- Fuel savings of 517€ per hectare/year;
- Savings in pesticides costs (25%);
- Efficient field tasks organisation and supervision;
- Improve revenue through better decision-making;

OTHER IMPACT

- Drift reduction (-48%);
- Reduce fuel consumption (-55%);
- Plant protection product reduction (-25%);
- Improve food-security due to pesticide treatment traceability;
- Establish cellular coverage and IoT functionalities in European rural areas.
3.6 BEVERAGE INTEGRITY TRACKING

The journey from producer to consumer is a process that can negatively affect the quality of the wine. In response to this risk, this use case has created an integrated system that monitors the whole wine and beverage distribution channel to prevent damages caused by integrity-related issues and stress factors such as humidity or shocks during shipping and storage. As a result, a direct relationship between producers and final retailers is established while a large database is created to plan safe shipments thereby allowing new and customised IoT-based insurance policies.

HOW IT WORKS

DATA LOGGERS monitor and record temperature, humidity, box breaching and shocks. Data are stored on an internal memory device, and wirelessly transmitted to the platform via the mobile App.

The CLOUD-BASED PLATFORM stores data coming from the devices, conducts elaborate analyses, aggregates trends and delivers information for decision making on customisable interfaces.

The MOBILE APP is the command interface of the devices: It turns them on and off, while assigning them to a specific transportation. At any time, with the data logger near, it can read every data and spot alerts.

THE IMPACT

OUR OBJECTIVES
- Reduce product damages during distribution.
- Deliver products to consumers in the best possible condition.
- Establish a direct connection between producers and final retailers.
- Build a valuable database on worldwide beverage logistics.
- Test the IoT system in collaboration with a network of about 100 stakeholders.

ON ECONOMY
- Tracking beverage conditions during distribution allows retailers and end-users to gain knowledge on the journey which in turn facilitates:
  - Reduction of shipping costs for beverages.
  - Decrease of client complaints and commercial disputes.
  - Insurance coverage possibilities.

OTHER IMPACT
- Creation of a direct relationship between producer and final retailer.
- Ensure the quality of wine during transport.
- Make the wine distribution process more transparent.
- Increase consumer satisfaction.
- Reduction of GHG emission related to beverage transport.
The cultivation of vegetables can be done in different climate conditions, such as (fully) controlled indoor greenhouses with an artificial lighting system, semi-controlled greenhouses or non-regulated open-air cultivation. IoT-technologies can help to increase the efficiency of these production processes, e.g. water and nutrients consumption or the supply of artificial light. The vegetables trial aims to improve the quality and the productivity of lettuce and tomatoes in the controlled cultivation and weeding of the vegetables in organic production.

For more info: IOF2020.EU/TRIALS/VEGETABLES
4.1 CITY FARMING LEAFY VEGETABLES

Consumers are increasingly critical about the quality, sustainability and traceability of their food. This is especially true for leafy vegetables used in convenience products such as cut lettuce and ready-to-eat salads where tolerance for dirt, insects or other unwanted ingredients is almost zero. This use case thus employs a commercial city farm to demonstrate the smooth integration of IoT technologies into the production of high-quality vegetables in a predictable and reliable manner, leveraging advantages in the production approach such as independence from seasonal influences, absence of plant diseases as well as pesticides.

4.2 CHAIN-INTEGRATED GREENHOUSE PRODUCTION

The chain-integrated greenhouse production use case aims to develop a web-based Decision Support System (DSS) for the greenhouse tomato supply chain based on IoT technology. The use case helps end-users with the challenges created by climate change and arable land scarcity, and the needs for productivity growth, increasing, fresh water and resource use efficiency. Standardised information alongside the integration of diverse data sources in different time scales increases interoperability throughout the production chain, and allows for easier quality and safety management, improves product and process traceability and reduces the environmental impact.

Weeding is one of the most important and frequent activities in organic vegetable farming. This use case automates the task through an intra-row weeder, detecting the crop and weeds based on machine vision. To elevate (organic) crop production to a higher level, farmers need site-specific information on their crops. Hence, data about the crop and weather are gathered to support the farmer. As the farmers need to perform multiple tasks simultaneously, the decision support regarding their crop management must be user-friendly. By using IoT devices this use case seamlessly combines multiple data sources to support the grower. Furthermore, improved crop and field monitoring results in better field management, reducing the labor required while increasing the yield.

The EU quality certification system and protected designation of origin (PDO) is a powerful tool to protect the quality of EU products, especially in foreign markets. The current standardised approach, however, is subject to fraud and the bureaucratic burden hinders its implementation. This use case solves these issues with the help of IoT technology to improve quality certification systems by reducing redundancies (overlap among certification schemes) time and effort of inspections while at the same time increasing their reliability. Sensor data and online registration can further provide solutions for traceability from field to shelf, proof of origin as well as production methods.

4.5 DIGITAL ECOSYSTEM UTILISATION

Currently, only a fraction of the plant protection products applied successfully tackles pests or insects, while the rest unnecessarily pollutes the environment. By utilising data stemming from IoT devices in the field, cloud computing and analytics technologies, this use case timely notifies the farmer to proceed with such activities while addressing challenges related to irrigation. Synergised parameters result in a service which increases the total farm productivity, contributing to food security. By incorporating innovative traceability technology, this use case integrates information from the entire food value chain to a marketplace, offering elaborate value propositions to users. Hence, it enables stakeholders in the agri-food sector to participate in an innovative digital ecosystem.

**PARTNERS**

- 10% IRRIGATION
+ 20% EFFICIENCY
- 10% PLANT PROTECTION PRODUCTS

**HOW IT WORKS**

This use case delivers tailored information to farmers based on the data acquired by IoT devices (low-cost weather stations) regarding high farm input-costs (plant protection, irrigation water). As a result, IoT devices, cloud computing and analytics technologies translate data into services and increase the Total Farm Productivity (TFP) factor which consequently assures food security.

In addition, the use case involves track and trace services and queries incorporating the achievements within IoF2020, being the first solution that delivers on- and post-farm traceability features. Lastly, an innovative marketplace where on- and post-farm information can be published and shared with external business entities to validate food content.

**THE IMPACT**

**OUR OBJECTIVES**

- Engage agri-food partners from Cyprus, Slovenia and Greece;
- Deploy more than 25 IoT devices in regions where IoF2020 has not been present so far;
- Provide IoT-enabled irrigation and plant protection services to farmers;
- Expand and evaluate the objectives and results to other use cases in the fruits and vegetables sectors.

**ON ENVIRONMENT**

- Efficiency improvement – farm visits per farm (-20%);
- Reduction of pesticide use – ratio of initial kg product / kg input (-5-10%);
- Water use reduction – ratio of initial kg product / kg (m3) input (-5-10%);
- Cost reduction / kg input (10%);
- Increased total factor productivity of farms.

**SOCIAL IMPACT**

- Connected IoT devices (<60);
- Increased IoT uptake among end-users;
- Information provision to consumers on growth and farm supply chain conditions;
- Boosted farm sustainability;
- Strengthened data privacy and security;
- Improved consumer trust.
The meat trial aims to improve the meat production chain's value through the application of IoT-technologies. The use cases include the management and optimization of pork production by on-farm sensors and slaughterhouse data. In addition, it will attest the role of IoT-technologies in poultry chain management, and communicate about meat transparency and traceability.

FOR MORE INFO: IOF2020.EU/TRIALS/MEAT
5.1 PIG FARM MANAGEMENT

The pork sector faces several challenges: high costs, a difficult market and increasing pressure concerning animal welfare and greenhouse gas emissions. Modern technology helps maximize work efficiency on farms, but only by combining the information gathered by individual controlling devices can precision livestock farming really be achieved. This use case’s application thus combines on-farm data and slaughtering results in one easy tool, providing the current-day pig farmer with crucial information to effectively steer the farm management in real-time. In these regards, this use case contributes to a future where PLF and individual pig monitoring might just be standard practice to guarantee the production efficiency and health of all pigs.

5.2 POULTRY CHAIN MANAGEMENT

Three critical points define the efficiency and product quality of the poultry production chain. This use case thus improves the performance through IoT driven technologies at each different stage, while facilitating linkages between all of them.

• Farm level: Monitor and optimise growing process to achieve a uniform and precisely measured slaughter weight;
• Logistics: Monitor and optimise broiler handling and transport to reduce impacts on the poultry and increase comfort levels;
• Processing plant: Optimise slaughtering and improve profitability and product-market fit, via traceability over all stages.

5.3 MEAT TRANSPARENCY AND TRACEABILITY

The pork market increasingly asks for high quality products, considering important aspects such as animal welfare, sustainability and meat free of antibiotics. Through pro-active auditing, quality criteria are checked regularly in order to give constructive feedback to the farmer. This use case supports the pro-active auditing process by offering a dashboard with crucial sustainability KPIs to auditors and advisors. The solution is based on well-established GS1 standards to ensure scalability, including the EPCIS solution for transparency. This leads to less auditing time and costs, shorter control intervals and faster actions in case quality issues occur.

5.4 DECISION-MAKING OPTIMISATION IN BEEF SUPPLY CHAIN

The beef supply chain is a complex system, involving crop farms, livestock farms, feedlots, transporters, slaughterhouses, retailers and consumers. Current traceability systems collect few data from every segment of the supply chain, mainly to assure food safety to consumers. Shared value systems based on integrated data allow every segment of the supply chain to improve production efficiency and product quality.

HOW IT WORKS

• Data acquisition throughout the entire supply chain is carried out through:
  - IoT stations are used for environmental and soil conditions in crop fields;
  - Smart collars and IoT ear tags for beef cows’ or calves’ location, activity and temperature;
  - IoT scales to gather information about fattening calves’ growth rate;
  - IoT multi-sensor stations for transport and slaughtering conditions - temperature, dust, noise, etc;
  - A FIWARE-based platform is used for the integration of the collected supply chain data;
  - Machine learning algorithms strengthen a decision support system focused on production efficiency and product quality;
  - A Hyperledger Fabric blockchain service ensures data traceability and immutability.

THE IMPACT

ON ECONOMY

• Fertiliser and water consumption (-10%);
• Reproduction rate (>90%);
• Animal losses (<5%);
• Total work effort (-15 %);
• Selling price through certification (+10%).

OTHER IMPACT

• Resource efficiency improvement: fertiliser, water and feed;
• Average fattening days (-15%);
• Greenhouse gas reduction through optimisation;
• Certification of grass-fed beef;
• Animal welfare improvement.
5.5 FEED SUPPLY CHAIN MANAGEMENT

The animal feed industry, mainly represented by feed suppliers and livestock farmers, currently faces great inefficiencies due to outdated supply chain management. Stakeholders struggle with the timing and quantity evaluation when restocking their feed silos, significantly affecting cost and labour efficiency. This use case thus develops an integral feedstock management system to optimise the entire supply chain.

HOW IT WORKS

Feed Supply Chain Management makes use of an IoT enabled, smart volumetric sensor, to obtain an accurate measure of the silos’ stock levels.

The INSYLO technology, consists of a 3D sensor with embedded algorithms that scans the inner silo and calculates the content’s volume.

The device is fully independent of the resources available on the farm as it is powered by solar energy and has embedded cloud connectivity systems. The cloud platform collects data from the silos along with relevant production information from livestock, farmers and feed suppliers. In combination with Big Data and AI, it enables the optimisation of refilling orders, production batches, shipping routes and raw materials purchases.

The app platform also provides web services to facilitate the transactions between feed suppliers and livestock farmers, allowing stakeholders easier data access. Ultimately, feed suppliers can automatically generate the refilling orders based on cost criteria and send them to the farmers who can accept or reject them with a simple click.

THE IMPACT

OUR OBJECTIVES

• Deploy and test three IoT-based Feed Supply Chain testbeds (2 small-scale + 1 large-scale);
• Demonstrate proposed solution’s technological and economic viability;
• Validate exploitation and scalability of the project results.

ON ECONOMY

• By translating silo stock level information into management information, farm efficiency gains are made as farmers and feed suppliers can optimise the supply chain.
• Reduction of feed supplier’s logistic costs (-10%);
• Annual savings per silo 250-500€;
• ROI per silo per year 150€;
• Farmer worktime efficiency savings -22 days per year.

OTHER IMPACT

• Reduction of CO2 Emissions (-10 to -15%);
• Logistics optimisation;
• Supplier inventory levels and production lots reduction;
• Decreased feed waste.
5.6 INTEROPERABLE PIG HEALTH TRACKING

Pig production’s substantial advancements over the last couple of decades has resulted in considerable improvements in productivity, allowing farms to be operated at a larger scale without losing efficiency. Changes in physiological parameters of pigs are good indicators for their state of health. This use case thus relies on intensive scrutiny of each animal through IoT sensors, enabling the farmer to swiftly intervene in case health risks or diseases occur. The advantage of sensors, measuring physiological parameters, is that the animals are monitored constantly, and the collected data can further be utilized to assess production management and support decision-making.

HOW IT WORKS

THE IMPACT

OUR OBJECTIVES
- Reduce risks of virus herd contamination;
- Enhance and optimise meat production;
- Cost-effective monitoring through non-intrusive sensors;
- Provide a data management platform for farmers & veterinarians;
- Management of piglet mortality and reduction of economic risks;
- Periodical health monitoring of the herd & follow-up of diseases.

ON ECONOMY
- Optimise pig production;
- Scalability of IoT sensor deployment in mass production;
- Reduce sick piglets (-15%);
- Replicate the deployment at international level;
- Improve traceability of livestock;
- Reduce antibiotics costs.

OTHER IMPACT
- Improved animal welfare (+50%);
- Reduced piglet mortality (-50%);
- Avoid unnecessary use of preventive antibiotics;
- Earlier detection of health issues (+15%);
- Reduced piglet diseases (-60%).
